IN THE UNITED STATES PATENT AND TRADEMARK OFFICE REFORE THE ROARD OF PATENT APPEALS AND INTERFERENCES

Serial No. 09/870,622 Confirmation No. 1783

I hereby certify that this correspondence is being transmitted to the United States Patent & Trademark Office via electronic submission or facsimile on the date indicated below:

08/03/2006 /Pamela Gerik/
Date Pamela Gerik

SUPPLEMENTAL APPEAL BRIEF

Sir/Madam:

Further to the Notice of Appeal faxed August 24, 2004 and received in the U.S. Patent and Trademark Office on the same day, Appellant presents this Supplemental Appeal Brief. This supplemental brief is filed in response to a Notice of Non-Compliant Brief mailed July 3, 2006. The Notice of Appeal was filed following mailing of a Final Office Action on May 27, 2004. Appellant hereby appeals to the Board of Patent Appeals and Interferences from a final rejection of claims 1-17 in the Final Office Action, and respectfully requests that this appeal be considered by the Board.

I. REAL PARTY IN INTEREST

The subject application is owned by International Business Machines Corporation, a corporation having its principal place of business at New Orchard Road, Armonk, New York, 10504, as evidenced by the assignment recorded at 011888, Frame 0535.

II. RELATED APPEALS AND INTERFERENCES

A Notice of Appeal has been filed for the following application, which shares a common specification with the application currently on appeal.

09/870,615 Notice of Appeal filed 9/14/04

09/870,621 Notice of Appeal filed 9/24/04

However, because dissimilar art is cited in the present application and the above-mentioned related application, Appellants do not believe that the outcome of this appeal will have any bearing on the Board's decision on the related appeal. No other appeals or interferences are known which would directly affect or be directly affected by or have a bearing on the Board's decision in this appeal.

III. STATUS OF CLAIMS

Claims 1-17 are pending in the captioned case. Claims 1-17 stand rejected.

IV. STATUS OF AMENDMENTS

No amendments to the claims have been filed subsequent to their final rejection. The Appendix hereto therefore reflects the current state of the claims.

V. SUMMARY OF CLAIMED SUBJECT MATTER

Appellant's claimed invention relates to a system of software components (82, 84 and 88, Fig. 8), a computer-readable storage device (18, Fig. 1) and a method (Figs. 8 and 10) for graphically displaying an object (object 24, Fig. 2) created by an application program (APP 28) running under, and at least somewhat dependent on, an operating system (OS 40). In accordance with aspects of the present invention, however, the object may be displayed in a manner that is truly independent from the operating system. (Specification – page 24, line 8 to page 29, line 10, and Abstract).

SN 09/870,622 Appeal Brief Page 2 of 22

In some embodiments, the system of software components may be provided for graphically displaying an object (e.g., Button 30, Fig. 8) in a manner independent from the operating system. The system of software components may be stored, for example, in a computer-readable storage device. In one example, the system of software components may include a graphics resource component (e.g., JButton 48), a proxy component (e.g., JButton Proxy 88) and one or more peer components (e.g., JButton Peer 82 and/or JComponent Peer 84). The peer component may be adapted for receiving events pertaining to the object, and for routing the events to the proxy component. The proxy component may associate the object with the graphics resource component and invoke methods of the graphics resource component for displaying the object in a manner independent from the operating system. Because the graphics resource component does <u>not</u> use native code (i.e., OS-dependent code) for rendering images (e.g., image 26) of the object upon a display, the graphics resource component may be considered a "lightweight software component." (Specification – page 24, line 23 to page 27, line 14, and Fig. 8)

In some cases, the presently claimed peer and proxy components may also be independent from the operating system. For example, the presently claimed peer component (e.g., JComponent Peer 84, Fig. 9) may be independent from the operating system (e.g., OS 40), but may be adapted to emulate the behavior of a second peer component (e.g., Component Peer 36), which does employ the windowing system of the operating system. In other words, the presently claimed peer component may be a "lightweight software component," which performs a function similar to the heavyweight version provided by the second peer component. Unlike the presently claimed peer component, however, the second peer component may contain native code (i.e., OS-dependent code), which may be used to invoke the graphical resources of the operating system (e.g., awt.dll 38) for creating an initial image (e.g., image 26) of the object (e.g., Button 30) upon a display. (Specification – page 27, line 16 to page 28, line 8, and Fig. 9)

In some cases, the object (e.g., Button 30, Fig. 10) may be part of a graphical user interface (GUI). When the object is included within a particular layout (e.g., Frame 41), the association of the object and the graphics resource component (e.g., JButton 48, Fig. 8) may enable a parent-child relationship to be established between the layout and the lightweight

SN 09/870,622 Appeal Brief Page 3 of 22

graphics resource component. By establishing such a parent-child relationship, the presently claimed proxy component (e.g., JButton Proxy 88, Fig. 10) may allow the lightweight graphics resource component to draw an image of the object over the initial image of the heavyweight object, which was drawn with the aid of the windowing system of the operating system and the second peer component. By redirecting key events associated with the object (such as, e.g., focus, mouse, sizing, etc.) to the proxy component, the presently claimed peer component (e.g., JButton Peer 82) may enable the proxy component to respond to the key events, as if it were part of the layout containing the original heavyweight object. As a result, the presently claimed peer and proxy components may be used for displaying lightweight versions of the heavyweight objects originally included with the application program, while maintaining object functionality and without modifying the original application program. (Specification – page 26, lines 7-14, page 28, line 10 to page 29, line 10, and Fig. 10)

In some embodiments, the presently claimed method (Figs. 8 and 10) for graphically displaying an object (e.g., Button 30) created by an application program running under an operating system (OS 40) may include the steps of: (i) utilizing a graphics resource component (e.g., JButton 48) adapted to display the object independently of the windowing system of the operating system, (ii) creating a proxy component (e.g., JButton proxy 88) and establishing an association between the object and the graphics resource component via the proxy component, (iii) receiving events pertaining to the object (e.g., focus, mouse, sizing, etc.) in a peer component (e.g., JButton peer 82) and routing them to the proxy component, and (iv) in response to the events, invoking methods of the graphics resource component via the proxy component to display the object. (Specification – page 25, line 1 to page 26, line 5, page 28, line 18 to page 29, line 10, and Figs. 8 and 10)

In some embodiments, the presently claimed computer-readable storage device (18, Fig. 1) may include a windows-based operating system (OS 40, Figs. 1-2) and an application program (APP 28) running under the operating system. In addition, the computer-readable storage device may include a graphics resource component (e.g., JButton 48, Fig. 8) adapted to display an object (e.g., Button 30), which was created by the application program independently of the windowing system of the operating system, by: (i) creating a proxy component (e.g.,

SN 09/870,622 Appeal Brief Page 4 of 22

JButton proxy 88) and establishing an association between the object and the graphics resource component via the proxy component, (ii) receiving events pertaining to the object (e.g., focus, mouse, sizing, etc.) in a peer component (e.g., JButton peer 82) and routing them to the proxy component, and (iii) in response to the events, invoking methods of the graphics resource component via the proxy component to display the object. (Specification – page 25, line 1 to page 26, line 5, page 28, line 18 to page 29, line 10, and Figs. 1, 2, 8 and 10)

VI. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL

Claims 1-17 stand rejected under 35 U.S.C. § 103(a) as being unpatentable over a web
publication provided by Sun, entitled *Introducing Swing* (hereinafter "IS-SUN") in view
of a web publication, entitled *Mixing Heavy and Light Components*, by Army Fowler
(hereinafter "M-SUN").

VII. ARGUMENT

The contentions of the Appellant with respect to the ground of rejection presented for review, and the basis thereof, with citations of the statutes, regulations, authorities, and parts of the record relied upon are presented herein for consideration by the Board. Details as to why the rejections cannot be sustained are set forth below.

A. Patentability of claims 1-6, 9-14 and 17 under 35 U.S.C § 103(a)

Independent claims 1, 9 and 17, and claims dependent thereon, were rejected as being unpatentable under 35 U.S.C. § 103(a) over a web publication provided by Sun, entitled *Introducing Swing* (hereinafter "IS-SUN") in view of another web publication, entitled *Mixing Heavy and Light Components*, by Amy Fowler (hereinafter "M-SUN").

MPEP 2143 establishes the basic requirements in finding a *prima facie* case of obviousness. As described, to establish a case of *prima facie* obviousness of a claimed invention, three criteria must be met. First, there must be some suggestion or motivation, either

SN 09/870,622 Appeal Brief Page 5 of 22

in the references themselves or in the knowledge generally available to one of ordinary skill in the art to modify the references or to combine reference teachings. Second, there must be a reasonable expectation of success. Finally, the prior art references must teach or suggest <u>all</u> the claim limitations. Specifically, "all words in a claim must be considered when judging the patentability of that claim against the prior art." *In re Wilson* 424 F.2d. 1382, 1385 (CCPA 1970). If an independent claim is nonobvious under 35 U.S.C. 103, then any claim depending therefrom is nonobvious. *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed. Cir. 1988). Using these standards, Applicants contend that the cited art fails to provide teaching, suggestion or motivation for all features of the currently pending claims, and furthermore, cannot be modified to do so. Several distinctive features of the present invention are set forth in more detail below.

IS-SUN and M-SUN each fail to provide teaching or suggestion for a system (claim 1), computer-readable storage device (claim 17), or method (claim 9) for graphical display of an object, where the system includes a peer component, which is adapted to receive events pertaining to the object and route the events to a proxy component, which associates the object with a graphics resource component and invokes methods thereof to display the object in a manner independent from an operating system. Independent claims 1, 9 and 17 each recite limitations on a graphics resource component, a peer component and a proxy component. These components are included within a new system of software components, referred to as "AWTSwing". As described in more detail below, IS-SUN and M-SUN each fail to provide teaching or suggestion for the presently claimed peer and proxy components.

The article entitled Introducing Swing does just as the title implies – it briefly outlines the Swing architecture and the basic differences between Swing and AWT. However, Introducing Swing (otherwise referred to as IS-SUN) does not provide teaching or suggestion for a system, computer-readable storage device, or method for graphical display of an object, where the system comprises a peer component, which is adapted to receive events pertaining to the object and route the events to a proxy component, which associates the object with a graphic resource component and invokes methods thereof to display the object in a manner independent from an operating system, as taught in present claims 1, 9, and 17.

SN 09/870,622 Appeal Brief Page 6 of 22

Statements in the Office Action mailed November 21, 2003 and in the final Office Action mailed May 27, 2004 admit that IS-SUN fails to provide teaching or suggestion for the presently claimed peer and proxy components. For example, the Examiner clearly states, "IS-SUN ... doesn't teach a proxy component which associates the object with the graphics resource component and invokes methods of the graphics resource component to display the object, or a peer component, adapted to receive events pertaining to the object and route the events to the proxy." (See, Office Action, page 2, Final Office Action, pages 2-3). Appellants sincerely appreciate the Examiner's recognition of the lack of teaching within IS-SUN for the peer and proxy components recited in present claims 1, 9, and 17.

Though the Examiner admits to the lack of teaching within IS-SUN for the presently claimed peer and proxy components, the Examiner suggests that such teaching can be found within the article entitled Mixing heavy and light components (otherwise referred to as M-SUN). For example, the Examiner states, "M-SUN teaches a method of implementing swing components similar to that of IS-SUN, but further teaches a proxy component that associates an object with a graphics resource component, and further displays the object, in that the proxy component is the swing class (see page 2, paragraph 2), and a peer component, adapted to receive events pertaining to the object and route the events to the proxy component, in that the peer component is the ancestor (see page 2, paragraph 2)." (See, Office Action, page 2; final Office Action, page 3). In addition, the Examiner suggests that "it would have been obvious to one of ordinary skill in the art... to modify the swing component interface of IS-SUN to include the combinational properties as did M-SUN." (Office Action, page 3, Final Office Action, page 3). The Appellants respectfully disagree with the Examiner's interpretation of peer and proxy components, for at least the reasons set forth in more detail below.

M-SUN cannot be combined with IS-SUN to overcome the deficiencies therein, because like IS-SUN, M-SUN fails to provide teaching or suggestion for the presently claimed peer and proxy components. Instead, M-SUN discloses various problems that may arise when programmers attempt to mix heavyweight AWT components with lightweight Swing components. Some of the problems disclosed by M-SUN are similar to those disclosed in the present specification. For example, M-SUN mentions some of the difficulties encountered when

SN 09/870,622 Appeal Brief Page 7 of 22

one attempts to add lightweight Swing components to an AWT layout by "painting" or "drawing" images of the Swing components over pre-existing AWT images. On page 3, M-SUN states that "[w]hen a lightweight component overlaps a heavyweight component, the heavyweight component is always on top, regardless of the relative z-order of the two components." On page 4, M-SUN illustrates how images rendered by heavyweight AWT components will obscure any overlapping images rendered by lightweight Swing components, and explicitly states that a "Swing label will never appear to be on top of [an] AWT label because the Swing label is rendering its contents in the native window of the frame (its first heavyweight ancestor), while the AWT label is rendering its contents in its own native window, which is actually a child of the frame's native window." As such, M-SUN recognizes a fundamental limitation of Swing, which does not permit images of Swing components to be drawn over AWT renderings.

The presently claimed case provides a solution to the above-mentioned problem by creating a proxy component, which is <u>not</u> included within the existing classes of software components belonging to the Swing application program interface (API). The presently claimed proxy component enables Swing components to be successfully incorporated within AWT-based application programs by associating the existing heavyweight (AWT) objects with lightweight (Swing) graphics resource components. This enables the proxy component to invoke the methods of the lightweight graphics resource components for displaying objects independently from the operating system. The presently claimed peer component differs from typical Swing peer components by routing events intended for the existing heavyweight object to the presently claimed proxy component. See, Specification, page 24, line 8 - page 29, line 10.

Unlike the presently claimed case, M-SUN provides <u>no</u> solution to the problem other than sheer avoidance. For example, M-SUN states, "[b]ecause there's sometimes no alternative to mixing heavyweight and lightweight components, we have provided a few options in Swing to make a certain level of component-mixing possible." (M-SUN, page 3, paragraph 2). These options, or guidelines, include: "[d]o not mix lightweight (Swing) and heavyweight (AWT) components within a container where the lightweight component is expected to overlap the heavyweight one." (M-SUN, page 5). From the above guideline, it is obvious that M-SUN

SN 09/870,622 Appeal Brief Page 8 of 22

chooses to avoid problematic situations, rather than present solutions to the problem. Since M-SUN fails to provide any solution of his own, M-SUN cannot be relied upon to disclose the presently claimed solution. In other words, M-SUN simply fails to provide any teaching or suggestion for the peer and proxy components recited in claims 1, 9, and 17.

In light of the Examiner's suggestion that "the proxy component [of M-SUN] is the swing class" and "the peer component [of M-SUN] is the ancestor," the Appellants wish to clarify the terms "class" and "ancestor" as they are used in the context of object-oriented programming and the presently claimed case. As described on pages 4 and 5 of the specification, a "class" is a fundamental entity in an object-oriented programming language that possesses certain attributes (e.g., shape, color, size, location on screen, behavior, etc.), which are common to all "objects" belonging to the class. The objects can be developed as modular building blocks, with subsequent objects referred to as "children" of higher-level "parent" objects. In some cases, a parent object may be a "class" of child objects, and the child objects may inherit the class attributes (i.e., the properties and methods) of the parent object, or "ancestor", from which they derive. In the embodiment of Fig. 8, for example, Component 32 may be considered a "class" of objects, where one of the objects in the class is Button 30. Component 32 may also be considered to be a "parent" or "ancestor" of Button 30, since various methods and/or properties of Button 30 may be derived from Component 32.

However, a "Swing class" cannot be considered to be a "proxy component" as suggested by the Examiner, since a "Swing class" merely defines the properties and methods (e.g., shape, color, size, location on screen, behavior, etc.) of a collection of Swing objects, whereas a "proxy component" actually functions to associate an object (e.g., a button displayed in a GUI) with a graphics resource component (e.g., JButton 48) and to invoke the methods of the graphics resource component (e.g., run the program code contained within JButton 48) for displaying the object. A "Swing class," in itself, does not and cannot function to associate an object with a graphics resource component, invoke the methods of the graphics resource component, or display the object. Therefore, the mere mention of Swing classes within M-SUN does not provide teaching or suggestion for the proxy component recited in present claims 1, 9, and 17.

SN 09/870,622 Appeal Brief Page 9 of 22

Furthermore, though a "peer component" may be an "ancestor" of some other object, merely stating so provides no evidence of the peer component being adapted to receive events pertaining to the object and to route the events to a proxy component. Since M-SUN fails to provide teaching for a "proxy component", any peer components that may be described by M-SUN cannot be configured to route events to a non-existent proxy component. As such, M-SUN also fails to provide teaching or suggestion for the peer component recited in present claims 1, 9, and 17.

The above arguments were presented in a Response to the Office Action mailed November 21, 2003. After reviewing the above arguments, the Examiner maintained his position in the final Office Action by providing yet another interpretation of the term "proxy component." For example, statements in the final Office Action suggest that "the swing class [of M-SUN] can be considered a proxy component in the sense that a proxy can mean an element that acts as a substitute for another element (swing for AWT)." (Final Office Action, page 7). As described in more detail below, the Appellants disagree with the Examiner's latest interpretation of a "proxy component," and further assert that a "Swing class" cannot be considered a "proxy component," as it is defined by the presently claimed case.

The Appellants recognize that, "[d]uring examination, the claims must be interpreted as broadly as their terms reasonably allow." (See, MPEP 2111.01). However, the Appellants assert that the pending claims cannot be interpreted more broadly than their terms reasonably allow, or be given a meaning that is inconsistent with the specification. The specification and present claims 1, 9 and 17 each describe the presently claimed "proxy component" as one that associates an object with a graphics resource component and invokes methods of the graphics resource component to display the object. Even when given its plain meaning, it is simply unreasonable for one skilled in the art to interpret the term "proxy component" as "an element that acts as a substitute for another element" since neither the specification nor the claims support such an interpretation. As such, the Examiner's interpretation of the term "proxy component" is considered to be improper and erroneous.

SN 09/870,622 Appeal Brief Page 10 of 22

In addition, the mere mention of Swing classes within M-SUN cannot be relied upon to provide teaching or suggestion for a proxy component, regardless of the manner in which the term "proxy component" is interpreted. As noted above, a "Swing class" merely defines the common properties and methods (e.g., shape, color, size, location on screen, behavior, etc.) associated with a collection of Swing objects that descend from the Swing class. However, a "Swing class" does not function to associate an object with a graphics resource component, nor does a "Swing class" invoke methods of the graphics resource component for displaying the object. Therefore, the mere mention of Swing classes with M-SUN does not provide evidentiary support for the presently claimed "proxy component", as it is defined by the specification and the present claims. Furthermore, and contrary to the Examiner's suggestions in the final Office Action, Swing classes are not "elements that act as substitutes for other elements," and more specifically, do not substitute Swing components for AWT components. Therefore, a "Swing class" cannot be considered equivalent to a "proxy component," even as it is improperly defined by the Examiner.

Further statements in the final Office Action appear to suggest that the presently claimed proxy component may be inherently taught by M-SUN. For example, the Examiner suggests that since M-SUN "teaches a combination of two APIs ... in order to combine two APIs there must be a connecting element." (Final Office Action, page 7). Again, Appellants assert that it is improper to oversimplify and loosely interpret the presently claimed proxy component as a "connecting element," since such interpretation is significantly more broad than allowed by the language used in claims 1, 9, and 17. Therefore, Appellants maintain the assertion that absolutely no teaching or suggestion for the presently claimed proxy component can be found, either explicitly or inherently described, within the sole reference (M-SUN) which the Examiner relies upon to provide such teaching.

There is no motivation to combine or modify the teachings of IS-SUN and M-SUN to provide the presently claimed peer and proxy components. As explained above, IS-SUN and M-SUN each fail to provide teaching or suggestion for the presently claimed peer and proxy components, and therefore, cannot be combined to do so. Even if the cited art were improperly

SN 09/870,622 Appeal Brief Page 11 of 22

combined, the combined cited art would still fail to provide teaching or suggestion for the peer and proxy components described in present claims 1, 9, and 17.

In addition, the cited art <u>cannot be modified</u> to teach or suggest the aforementioned limitation, since IS-SUN and M-SUN each fail to suggest a desirability for doing so. The mere fact that references can be combined or modified does not render the resultant combination obvious unless the prior art also suggests the desirability of the combination [or modification]. In re Mills, 916 F.2d 680, 16 USPO2d 1430 (Fed. Cir. 1990); MPEP 2143.01.

Unlike the presently claimed case, IS-SUN fails to mention the difficulties involved in mixing heavyweight AWT components and lightweight Swing components. Consequently, IS-SUN provides no desirability for overcoming such difficulties by providing lightweight peer and proxy components, as described in claims 1, 9 and 17. Though M-SUN does admit to some difficulties in mixing heavyweight AWT components and lightweight Swing components, M-SUN chooses to deal with the difficulties by avoiding the problematic situations altogether. By choosing avoidance, M-SUN fails to provide motivation for a system or method that actually solves the problem. Since IS-SUN and M-SUN each fail to provide motivation to teach or suggest the aforementioned limitations of the presently claimed case, IS-SUN and M-SUN cannot be modified to do so.

Obviousness can only be established by combining or modifying the teachings of the prior art to produce the claimed invention where there is some teaching, suggestion, or motivation to do so. *In re Fine*, 837 F.2d 1071, 5 USPQ2d 1596 (Fed.Cir. 1988); *In re Jones*, 958 F.2d 347, 21 USPQ2d 1941 (Fed. Cir. 1992); MPEP 2143.01. Appellants assert that the teaching or suggestion to make the claimed combination [or modification] must be found in the prior art, and not based on Applicant's own disclosure. *In re Vaeck*, 947 F.2d 488, 20 USPQ2d 1438 (Fed. Cir. 1991); MPEP 2142.

SN 09/870,622 Appeal Brief Page 12 of 22

B. Patentability of claims 7, 8, 15 and 16 under 35 U.S.C § 103(a)

Claims 7-8 and 15-16 were rejected under 35 U.S.C. § 103(a) as being unpatentable over IS-SUN in view of M-SUN. Because claims 7-8 and 15-16 are dependent from independent claims 1 and 9, respectively, the arguments presented above for patentability of claims 1 and 9 apply equally to claims 7-8 and 15-16, and are herein incorporated by reference. In addition to the § 103 arguments presented above with respect to claims 1 and 9, additional arguments are provided below to establish patentability of dependent claims 7-8 and 15-16.

None of the cited art teaches or suggests that, when the object is part of a layout, the association of the object with the graphics resource component can be used to establish a parent-child relationship between the layout and the graphics resource component, which can then be used to allow the lightweight graphics resource component to draw over an existing image of the object drawn with the aid of the windowing system of the operating system. Claims 7-8 and 15-16 place a further limitation on the presently claimed proxy component. For example, claims 7-8 and 15-16 state that when the object is part of a layout, the association of the object with the graphics resource component establishes a parent-child relationship between the layout and the graphics resource component, which allows the graphics resource component to draw over an existing image of the object drawn with the aid of the windowing system of the operating system. As such, claims 7-8 and 15-16 place additional limitations on the proxy component introduced in claims 1 and 9, respectively, by describing how the proxy components may establish a parent-child relationship, which allows lightweight (i.e., Swing) graphics resource components to "draw" or "paint" over existing images of heavyweight (i.e., AWT) objects drawn with the graphical resources of the operating system.

As noted above, IS-SUN and M-SUN each fail to disclose the presently claimed peer and proxy components, and furthermore, cannot be modified or combined to do so. As described in more detail below, IS-SUN and M-SUN also fail to provide teaching or suggestion for the additional limitations placed on the presently claimed proxy component, as set forth in dependent claims 7, 8, 15, and 16.

SN 09/870,622 Appeal Brief Page 13 of 22

Statements in the final Office Action rely on M-SUN for teaching the limitations of dependent claims 7, 8, 15, and 16. For example, the final Office Action states, "M-SUN teaches, in page 4, paragraph 2 and page 6, paragraph 2 and the following picture, that if heavyweight components are used it is possible for them to obscure what is drawn by the windowing system of the operating system." (Final Office Action, page 5). The Appellant agrees with the Examiner's current interpretation of M-SUN. Heavyweight (AWT) components included within prior art legacy applications will, in fact, obscure any lightweight (Swing) components, which are purposefully or inadvertently placed underneath the heavyweight components. For example, M-SUN illustrates the case in which a heavyweight label is drawn on top of a lightweight label on page 4.

However, the Examiner's current interpretation is completely inconsistent with the limitations recited in dependent claims 7, 8, 15, and 16, which describe how a parent-child relationship may allow a lightweight graphics resource component (see, claims 1 and 9) to draw over an existing image of a (heavyweight) object drawn with the aid of the operating system.

Because M-SUN clearly states that lightweight Swing objects "will never appear to be on top" of heavyweight AWT objects (see, pages 3-4 of M-SUN), M-SUN cannot be relied upon to provide teaching or suggestion for the additional limitations set forth in dependent claims 7, 8, 15, and 16

There is no motivation to modify or combine the cited art to teach or suggest the presently claimed parent-child relationship. As noted above, none of the cited art provides teaching or suggestion for the presently claimed parent-child relationship, which allows a (lightweight) graphics resource component to draw over an existing image of a (heavyweight) object drawn with the aid of the operating system, as described in claims 7-8 and 15-16.

In addition to the lack of teaching, Appellants assert that the cited art cannot be combined or modified to teach or suggest the presently claimed parent-child relationship, since the cited art fails to suggest a desirability for doing so. The mere fact that references can be combined or modified does not render the resultant combination obvious unless the prior art also suggests the

SN 09/870,622 Appeal Brief Page 14 of 22

desirability of the combination. *In re Mills*, 916 F.2d 680, 16 USPQ2d 1430 (Fed. Cir. 1990); MPEP 2143 01

As noted above, M-SUN fails to provide a manner in which lightweight graphics resource components can be used to successfully draw over images previously drawn with the aid of the operating system. Instead, M-SUN strongly recommends that programmers "[d]o not mix lightweight (Swing) and heavyweight (AWT) components within a container where the lightweight component is expected to overlay the heavyweight one." (M-SUN, page 4, paragraph 3). By choosing avoidance, rather than presenting a solution to the problem, M-SUN provides no desirability for the presently claimed parent-child relationship. As such, M-SUN cannot be modified to teach or suggest the additional limitations set forth in dependent claims 7, 8, 15, and 16

For at least the foregoing reasons, Appellant asserts that independent claims 1, 9, and 17, as well as claims dependent therefrom, are patentably distinct over IS-SUN and M-SUN. Contrary to the characterizations made in the various Office Actions, the cited references cannot be properly combined or modified to provide teaching for all limitations recited in claims 1, 9, and 17. Accordingly, Appellants assert that a *prima facie* case of obviousness has not been duly set out and, therefore, request that this rejection be reversed.

* *

For the foregoing reasons, it is submitted that the Examiner's rejection of claims 1-17 was erroneous, and reversal of the decision is respectfully requested.

The Commissioner is authorized to charge the required fees to Daffer McDaniel LLP deposit account number 50-3268/5468-07300.

Respectfully submitted, /Kevin L. Daffer/ Kevin L. Daffer Reg. No. 34,146 Attorney for Appellant

Customer No. 35617 Date: August 3, 2006

JMF

VIII. CLAIMS APPENDIX

The present claims on appeal are as follows.

- A system for graphical display of an object created by an application program running under an operating system, comprising:
 - a graphics resource component adapted to display the object independently of the operating system;
 - a proxy component, which associates the object with the graphics resource component and invokes methods of the graphics resource component to display the object; and
 - a peer component, adapted to receive events pertaining to the object and route the events to the proxy component.
- The system as recited in claim 1, wherein the peer component is independent of the
 operating system, and emulates the behavior of a second peer component that employs the
 windowing system of the operating system.
- The system as recited in claim 1, wherein the object is part of a graphical user interface (GUI) associated with the application program.
- The system as recited in claim 3, wherein a look and feel of the GUI is independent of the operating system.
- The system as recited in claim 1, wherein the application program is written in Java programming language.

SN 09/870,622 Appeal Brief Page 17 of 22

- The system as recited in claim 1, wherein the proxy extends an existing class of software components belonging to the Swing application program interface (API).
- 7. The system as recited in claim 1, wherein the object is part of a layout, and the association of the object with the graphics resource component establishes a parent-child relationship between the layout and the graphics resource component.
- 8. The system as recited in claim 7, wherein the parent-child relationship between the layout containing the object and the graphics resource component allows the graphics resource component to draw over an existing image of the object drawn with the aid of the windowing system of the operating system.
- A method for graphical display of an object created by an application program running under an operating system, comprising:
 - utilizing a graphics resource component adapted to display the object independently of the windowing system of the operating system;
 - creating a proxy component and establishing an association between the object and the graphics resource component via the proxy component;
 - receiving events pertaining to the object in a peer component and routing them to the proxy component; and
 - in response to the events, invoking methods of the graphics resource component via the proxy component to display the object.
- 10. The method as recited in claim 9, wherein the peer component is independent of the operating system, and the method further comprises emulating the behavior of a second peer component that employs the windowing system of the operating system.

SN 09/870,622 Appeal Brief Page 18 of 22

- The method as recited in claim 9, wherein the object is part of a graphical user interface (GUI) associated with the application program.
- 12. The method as recited in claim 11, wherein a look and feel of the GUI is independent of the operating system.
- The method as recited in claim 9, wherein the application program is written in Java programming language.
- 14. The method as recited in claim 9, wherein the proxy extends an existing class of software components belonging to the Swing API.
- 15. The method as recited in claim 9, wherein the object is part of a layout, and the method further comprises using the association of the object with the graphics resource component to establish a parent-child relationship between the layout and the graphics resource component.
- 16. The method as recited in claim 15, further comprising using the parent-child relationship between the layout containing the object and the graphics resource component to allow the graphics resource component to draw over an existing image of the object drawn with the aid of the windowing system of the operating system.
- 17. A computer-readable storage device, comprising:
 - a windows-based operating system;
 - an application program running under the operating system;
 - a graphics resource component adapted to display an object created by the application program independently of the windowing system of the operating system, by:

SN 09/870,622 Appeal Brief Page 19 of 22

creating a proxy component and establishing an association between the object and the graphics resource component via the proxy component;

receiving events pertaining to the object in a peer component and routing them to the proxy component; and

in response to the events, invoking methods of the graphics resource component via the proxy component to display the object.

X. RELATED PROCEEDINGS APPENDIX

A Notice of Appeal has been filed for the following application, which shares a common specification with the application currently on appeal.

09/870,615 Notice of Appeal filed 9/14/04

09/870,621 Notice of Appeal filed 9/24/04

However, because dissimilar art is cited in the present application and the above-mentioned related application, Appellants do not believe that the outcome of this appeal will have any bearing on the Board's decision on the related appeal. No other appeals or interferences are known which would directly affect or be directly affected by or have a bearing on the Board's decision in this appeal.
